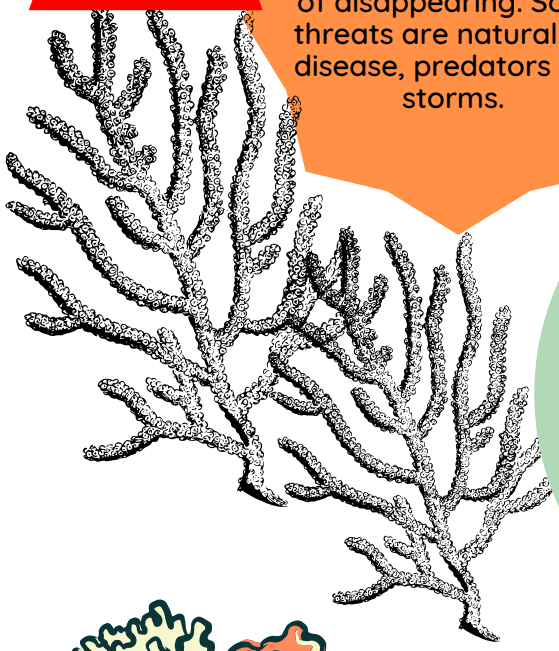
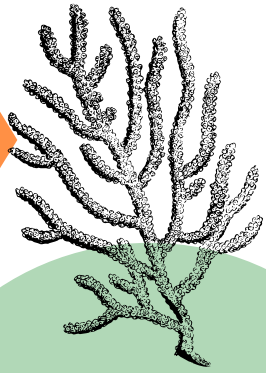
Coral Reef Facts

ALERT
DID YOU KNOW?

Coral reefs are in danger of disappearing. Some threats are natural like disease, predators and storms.





Other threats are caused by people, including pollution, unsustainable fishing practices, and climate change. With raising ocean temperatures and increased carbon dioxide in the water, this causes stress to corals, leading to coral bleaching.

Coral reefs can evolve naturally and adapt to climate change if we keep them healthy. There are practical things all of us can do.

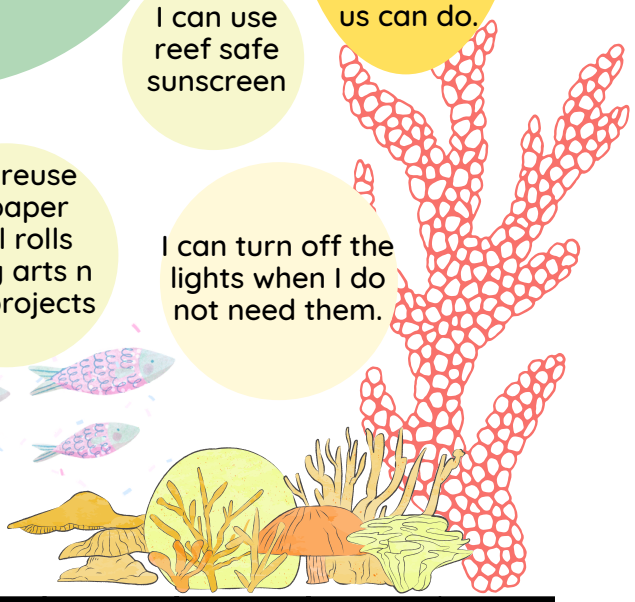
I can use reef safe sunscreen

I can walk or bike

I can reuse old paper towel rolls for my arts n craft projects

I can turn off the lights when I do not need them.

I can compost



coral reef
